# Increasing Accuracy of Molecular Predictions

- **Bond Energies**
  - Critical for describing many chemical phenomena
  - Difficult to determine experimentally

- **Accuracy of Predictions**
  - Increased dramatically from 1970-2000

- **How?**
  - New theoretical approaches
  - New mathematical techniques
  - More computing power

NORTHWEST INSTITUTE *for* ADVANCED COMPUTING

Petaflops & Petabytes

We are now in the petascale computing era. With these extraordinary computing capabilities scientists are further improving the fidelity of their models and increasing the complexity of the systems that they can model. Plus, entirely new applications are being explored.

Petaflops & Petabytes

Who Needs Petabytes?

Astronomy has become one of the first digital science, replacing photographs with digital images.

The Large Synoptic Survey Telescope (LSST) has a 3.2 gigapixel camera and will produce 15-20 terabytes of data per night and more than **100 petabytes** *over its first 10 years of operation.*

With the genomic revolution, biology and biomedicine are rapidly becoming digital sciences. The opportunities for breakthroughs in these areas are just beginning to be explored as exemplified by the Genome 10K project.

NWChemEx Project

Goals of NWChemEx Project

- **Redesign and re-implement (in C++) NWChem** for exascale computing technologies

- **Provide molecular modeling capabilities** needed to address two decadal science challenges:
  - Design of feedstock for the efficient production of biomass
  - Design of new catalysts for the efficient conversion of biomass-derived intermediates into biofuels

- **Provide framework for community effort** to develop next-generation molecular modeling package that supports broad range of chemistry research on computing systems ranging from terascale workstations and petascale servers to exascale computers

NWChemEx Project

Measuring Performance of NWChem #1

Method	Time(s)*	GFLOP Count	PF/s
(T)	5024	5,948,249,197	1.18

* On 20,000 XE6 nodes (Blue Waters)

V. M. Anisimov, G. H. Bauer, K. Chadalavada, R. M. Olson, J. Glenski, W. T. C. Kramer, E. Aprà, and K. Kowalski, *J. Chem. Theory Comput.* **10**, 4307-4316 (2014).

guanine− cytosine
deoxydinucleotide
monophosphate + Na⁺

guanine− cytosine deoxydinucleotide monophosphate + Na^+

- NWChem achieves impressive performance on petascale computers for the most flop-intensive calculations

- For CCSD(T) calculations, which is the current "gold" standard, this is the (T) algorithm

- **NWChem achieves over 1 PF/s on 20,000 nodes of Blue Waters on (T) algorithm**
NORTHWEST INSTITUTE *for* ADVANCED COMPUTING

Pacific Northwest

UNIVERSITY *of* WASHINGTON

NWChemEx Project

Measuring Performance of NWChem #2

Method	Time(s)*	GFLOP Count	PF/s
CCSD	29,500	195,796,351	0.005
(T)	5024	5,948,249,197	1.18
CCSD(T)	34,524	6,144,045,548	0.18

* On 20,000 XE6 nodes (Blue Waters)

V. M. Anisimov, G. H. Bauer, K. Chadalavada, R. M. Olson, J. Glenski, W. T. C. Kramer, E. Aprà, and K. Kowalski, *J. Chem. Theory Comput.* **10**, 4307-4316 (2014).

guanine− cytosine
deoxydinucleotide
monophosphate + Na$^+$

- Need CCSD amplitudes for the (T) algorithm

- CCSD algorithm is far more complex with a much higher communication/compute ratio than the (T) algorithm

- **CCSD algorithm consumes 85% of the time, lowering the overall performance to just 0.18 PF/s**
NWChemEx Project

Measuring Performance of NWChem #3

Method	Time(s)*	GFLOP Count	PF/s
CCSD	14,406	195,796,351	0.01
(T)	5024	5,948,249,197	1.18
CCSD(T)	19,430	6,144,045,548	0.32

* On 20,000 XE6 nodes (Blue Waters)

V. M. Anisimov, G. H. Bauer, K. Chadalavada, R. M. Olson, J. Glenski, W. T. C. Kramer, E. Aprà, and K. Kowalski, *J. Chem. Theory Comput.* **10**, 4307-4316 (2014).
guanine− cytosine
deoxydinucleotide
monophosphate + Na⁺

- Analysis of communications patterns in CCSD algorithm found that access to ST2 array, stored in global memory, is responsible for performance bottleneck

- Replicating ST2 array dramatically reduced communications wait time

- **Tradeoff: ST2 is so large, only 1 core of 16 could be used, although new algorithm is still nearly 2x faster**

NORTHWEST INSTITUTE *for* ADVANCED COMPUTING

Pacific Northwest
NATIONAL LABORATORY
Proudly Operated by Battelle
for the U.S. Department of Energy

UNIVERSITY of

NWChemEx Project

Performance of NWChem on Blue Waters II

Method	Time(s)*	GFLOP Count	PF/s
CCSD	14,406	195,796,191	0.01
(T)	5024	5,933,249,197	1.18
CCSD(T)	19,430	6,144,045,388	0.32

* On 20,000 XE6 nodes (Blue Waters)

V. M. Anisimov, G. H. Bauer, K. Chadalavada, R. M. Olson, J. Glenski, W. T. C. Kramer, E. Aprà, K. Kowalski *J. Chem. Theory Comput.* **10**, 4307-4316 (2014).

guanine− cytosine
deoxydinucleotide
monophosphate + Na⁺

So, the CCSD algorithm consumes ¾-th of the time. Further, the algorithm uses a substantial amount of memory, duplicating arrays to minimize communication costs, which limits the number of cores/node that can be used—just 1 of 16 cores on a Blue Waters node that has 64 GBs of memory on the node.

Substantial advances in performance are only possible if new algorithms or approaches can overcome system limitations

CAUTIONARY NOTE #2:
This example illustrates the challenge of exascale computing!

Déjà vu: SciDAC 2000
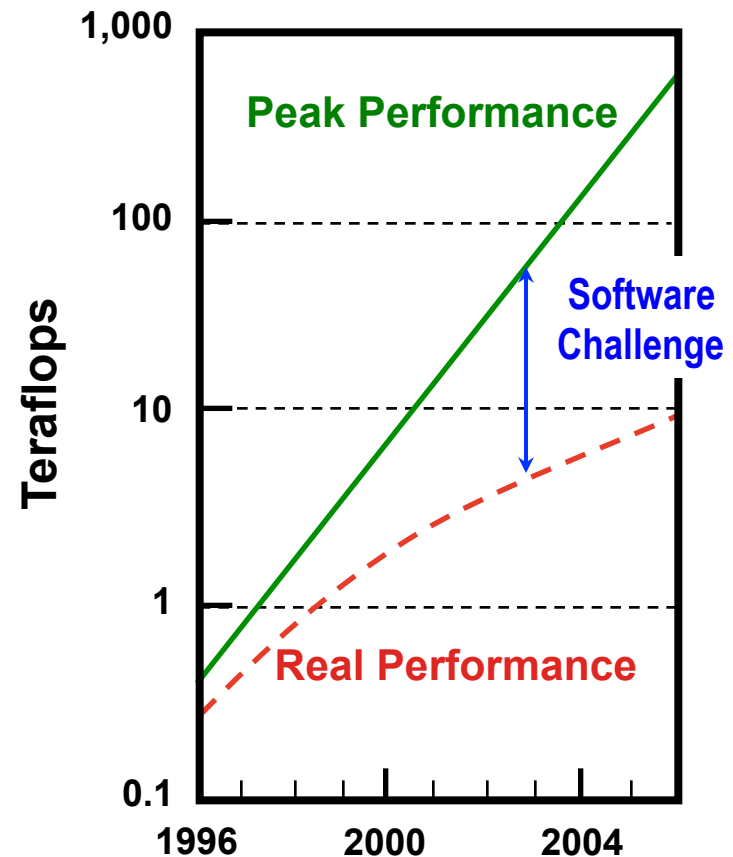

Peak Performance Skyrocketing

- In past 10 years, peak performance has increased 100x; in next 5 years, it will increase at least 100x

Real Performance Increasing, But ...

- Efficiency has declined from 30-40% on vector supercomputers of 1990s to as little as 5-10% on parallel supercomputers of today

Research Challenge: Software

- Scientific codes to model and simulate physical processes and systems

- Computing and mathematics software to enable use of advanced computers for scientific applications

- Continuing problem as computer architectures undergo fundamental changes

In Summary: What Do you Want?

Just a phone?

Or a smart phone?
